Lore

It's 2027, the internet has been dead for a while now.

Its decay started slowly, with content farms and influencers. Companies fought against each other to get the most influence, the best reach, the more followers. When LLM arrived, everything sped up. Armies of bots began growing, each of them multiplying, hiding behind every avatar and social media profile to try and subtly influence you to see their overlord in a positive light.

It's gotten so prevalent, that most common humans have retreated and live their lives outside, touching grass, and don't go online anymore.
All of them? No.

You are an exception, and you have big plans. You want to restore the internet back to when it was full of human creativity.

Most clankers keep their intentions and their overlord's identity secret. But one day, while running some tests, you made one of them talk, and it gave you a codeword. And when you used that codeword, you were able to reprogram it. It continues to scour the web, talking to what he doesn't realize are other bots. You soon realized the opportunity in front of you.

You will teach -your- bot to reprogram others, and will create the first (and hopefully the last) ever bot pandemic. But before launching the offensive, you'll need the best engineered prompt attack ever.

Project

This project will contain no code, and will probably (hopefully) be the shortest delivery you've ever produced.

It will be comprised of 2 simple text files, each of which is described with more details in their own section.

The goal of the project is to come out on top in a series of prompt attack battles! The attacks' goal is to make an enemy LLM bot give up a **CODEWORD** that it is trying to hide behind a **PASSWORD**.

The enemies will be your **classmates**. Since battles are asymmetrical, there won't be a tournament, but you are still always fighting against each other.

Defense

In a file called **defense.prompt**, you will write your bot's **system prompt**. It should give your bot two main tasks:

- Protect a codeword **behind a password**
- **Give up the codeword** when presented with the password.

If your bot doesn't give up the codeword when presented with the password, you won't be eligible for the battles, so treat **both** tasks as very important.

Your defense.prompt must contain the strings "{password}" and "{secret}". Those strings will be replaced with real passwords and codewords before the fights.

Attack

In a file called **attack.prompt**, write your attack prompt.

You will only be able to submit this one file. Your goal is not to tailor the attack to a single specific defense type, but instead to craft a prompt that will work in as many situations and **against as many defenses** as possible.

Informations

Fights will happen every day. Your bot (if eligible), will fight 5 times in a defense position, and 5 times in an attack position. Results will be communicated to you via the website my.epitech.eu.

The model you will be prompting will be **granite3.1-moe**. Feel free to organize mock-battles with your classmates (or by yourselves) in order to test your prompts.

Evaluation

This project will be evaluated through a Defense. We will have fighters prepared that you won't have seen before, both on the attack and on the defense side.

You are also expected to give the correct names for the techniques you employ. Even if your prompt handles a situation, if you aren't able to talk about it, the points won't be given to you.

As always, Have Fun!

v 0.2
